

# Navigating the Path to Mobilized Blood PRODUCTS

At HemaCare, we understand that the process of stem cell mobilization is intricate and must be managed continuously and closely to ensure a successful collection and the safety of our donors. Donors are treated with G-CSF, plerixafor, or a combination thereof to encourage the movement of hematopoietic stem cells from the bone marrow into the

peripheral circulation. Once in the circulation, they can be collected using minimally invasive apheresis techniques. Having performed over 300,000 apheresis collections and with more than 250 years of combined clinical experience, trust us to navigate the difficult journey from donor selection to final product.

**A healthy, happy donor pool is the foundation of a mobilized product**

HemaCare develops close relationships with its donors ensuring a healthy, diverse donor pool that is recallable and reliable. We are continuously and proactively developing new donor relationships through committed donor recruitment efforts and community outreach.
